

Additions and changes in the flow chart diagram

DataAccessLayer	We changed completely the DAL diagram, due to inefficient methods and overall wrong implementation that could have cost us a lot of work later when we had to connect the BL to the DAL. Instead we made an abstract class (DalController) that get extended by each entity with a table in the db and DAL Object (DTO) for each entity as well.
BuisnessLayer Red	Changes that made due to new requirements from the client
BuisnessLayer Blue	Changes we made to implement the connection between the BL and DAL
BuisnessLayer BoardController	We tackled an issue that we couldn't fetch bulk of boards and changing/inserting boards to the database, so we added a BoardController.
